SUMMARY

Computer Vision Engineer with ~5 years in robotics and machine vision: camera calibration, stereo depth, 3D coordinate transforms, and real-time detection on edge hardware (NVIDIA Jetson, Intel RealSense). Builds and owns production CV pipelines in Python and C++, from algorithm to field deployment.

EXPERIENCE

Computer Vision Engineer

Pek Automotive

April 2025 – Present, Logatec, Slovenia

- Owned the end-to-end perception-to-picking pipeline for autonomous multi-arm apple and orange harvesting robots (camera calibration, object detection, depth estimation, picking logic); brought the previously non-operational system to field-ready operation and served as the responsible CV engineer during field deployments in five countries.
- Designed a three-stage camera-to-arm calibration pipeline (per-arm 2D polynomial regression, linear misalignment correction, camera tilt compensation during arm extension) that replaced a manual procedure, achieving 5 mm max positional error (2 mm std) against a 10 mm production threshold; added outlier rejection, R^2 validation, automatic retry, and UART status reporting so operators can verify results without a PC.
- Improved Intel RealSense D435 depth accuracy by replacing peak-based depth with a histogram front-surface search and fruit pixel masking, reducing systematic overestimation from fruit geometry and foliage; also corrected perspective-projection bias in fruit diameter estimation.
- Implemented saturation-based camera exposure control that adapts faster than default auto-exposure under changing sunlight, reducing overexposed infrared (IR) and depth frames.
- Built a semi-automated annotation workflow from 700 GB of field recordings and retrained YOLO instance segmentation models on occluded fruit clusters, improving detection of partially visible fruit.
- Designed picking logic for clustered fruit, including dual-arm coordination, frontmost-first picking with rescans, and re-identification by diameter and position to prevent duplicate picks and damage to adjacent fruit.
- Owned production deployment for the Intel NUC fleet: automated Ubuntu image builds (autoinstall, post-install provisioning), systemd service management, remote deployment and log collection, and Linux camera driver debugging; built robot simulation mode and field-log replay tools for hardware-free development.

Software Engineer

Robsys Robotic Systems

March 2024 – March 2025, Istanbul, Turkey

- Built an autonomous navigation system from scratch for a cleaning robot (custom SLAM, pathfinding, obstacle avoidance), since off-the-shelf SLAM frameworks did not run on the target hardware.
- Developed a multi-sensor fusion pipeline on NVIDIA Jetson combining stereo cameras, gyroscopes, and ultrasonic sensors; trained custom deep learning models for environmental perception and wrote low-level firmware for sensor synchronization and motor control.
- Co-designed a UART protocol with an embedded engineer for bidirectional data exchange between the robot's motherboard and its subsystems.
- Integrated real-time telemetry and camera streaming into a mobile app for remote monitoring, control, and safety operations.

AI Developer

Bomensorsoft

January 2024 – February 2024, London, UK (Remote)

- Optimized AI models and extended backend and web features (Python, JavaScript).

Computer Vision Engineer

Doğru Holding (DGR Project)

May 2023 – December 2023, Istanbul, Turkey

- Developed a face recognition system on Jetson Nano with 98% accuracy, 30% fewer false positives, and face embeddings stored in 4 KB on-device.
- Built a stereo-camera liveness detection module from scratch: extracted per-keypoint facial depth profiles, collected a labeled real vs. spoofed dataset, and trained a lightweight TensorFlow model to reject spoofing attempts.
- Implemented performance-critical components in C++ and exposed them to the Python pipeline as native extensions to run in real time on constrained hardware.
- Built a real-time AI video pipeline that anonymized people in security camera feeds with YOLO-based detection and per-detection overlays, then streamed to YouTube Live at a stable 30 fps; kept per-frame processing under 30 ms by modifying the streaming library to manipulate outgoing frame packets directly.

Autonomous Vehicle Development Engineer

Doğru Holding (ZGN Autonomous & Robotics)

December 2022 – May 2023, Istanbul, Turkey

- Optimized the pathfinding algorithm for autonomous vehicles, reducing processing time by 30%.
- Designed an algorithm that lets robots build maps directly from construction blueprints.

Machine Vision Engineer

Gensys Automation & Machine Vision

December 2021 - December 2022, Kocaeli, Turkey

- Developed machine vision applications in Halcon and C#, integrated into MSSQL-backed desktop tools, and commissioned systems on-site.
- Led a TUBITAK-funded thermal NDT research project: modeled heat diffusion analytically, built a halogen-lamp and thermal-camera test setup, and developed a desktop application that estimated the depth of subsurface defects in PLA parts.
- Developed an automated image-cropping tool to preprocess data for ML training.

Machine Vision Intern

Mavis Machine Vision

July 2020 - March 2021, Kocaeli, Turkey

- Built image-processing applications in Halcon and C# with SQL database integration.

PROJECT

Web-Based AR Face Filter Platform

Side Project

- Real-time multi-face detection and tracking (up to 8 faces) powering 30+ WebGL/Three.js AR filter effects.
- Subscription and device-licensing backend with a Node.js REST API and Supabase (PostgreSQL).
- GitOps pipeline with GitHub Actions, multi-arch Docker builds (ARM64/AMD64), and Watchtower auto-updates on Raspberry Pi devices; multi-stage builds cut image size by 60%.

EDUCATION

B.Sc. in Mechatronics Engineering

Marmara University · Istanbul, Turkey · March 2021

SKILLS

Languages: Python, C++, C#, JavaScript, SQL

Computer Vision: Camera calibration, stereo vision, depth sensing, 3D coordinate transforms, object detection and segmentation, OpenCV, YOLO, Halcon

Machine Learning: PyTorch, TensorFlow, NumPy

Hardware and Embedded: NVIDIA Jetson, Intel RealSense, UART, Linux

Infrastructure: Docker, GitHub Actions, Git, Prometheus, Grafana
